Exp 1 report : Basic Linux commands

Learnings and experiences : In this experiment we
performed various Linux commands. This exercise
proved to be a nice introduction to the Linux
command line interface as for me, it was the first time
performing operations like making files in directories solely
through a CLI. Apart from the basic commands like
creating/deleting file directories, we also learnt how to
display files in different ways by using commands like
cat, tac, sort, etc. Used regular expressions for
actions like filtering and also covered a few
basic networking related commands (ip, host, etc.).

Errors encountered:

The biggest error was encountered by while trying to
run the maild command. Apart from there, there
were numerous errors because of typing mistakes.
several errors occured because I tried executing
commands which require root super user privileges
without prefixing them with sudo. Some errors were
also encountered because certain commands had to
be install. Most of these errors were solved by
a bit of googling and reading documentation
and tutorials.
